

DEVOPS MASTER COURSE

Volume 14F

AI Platform Projects, Interviews and Final Capstone

Projects | Red Teaming | Troubleshooting | Certifications | Leadership | Capstone

Chapters 56-70 | 2026 Edition

Beginner to Enterprise Mastery

About This Part

Part F is the DataOps, MLOps and LLMOps graduation sequence with production projects, security reviews, debugging exercises, senior interviews and a complete enterprise AI platform.

2026 curriculum note: AI technologies and certification programs change rapidly. Learners must verify official provider, Kubeflow, Ray, MLflow and Kubernetes resources immediately before production use or exam booking.

Volume 14 Roadmap

Part	Coverage	Status
14A	DataOps and modern data-platform foundations	Course sequence
14B	MLOps lifecycle, registry and monitoring	Course sequence
14C	Kubeflow, Ray and distributed AI infrastructure	Course sequence
14D	Model serving, RAG, agents and LLMOps	Course sequence
14E	AI infrastructure operations, security, risk and FinOps	Course sequence
14F	Projects, interviews and final AI platform capstone	Current part

Scope, Safety and Professional Practice

- Use disposable sandboxes, local simulations or approved training subscriptions. Configure budgets, quotas and expiry before creating resources.
- Never use production identities, customer data, employer account structures, internal addresses or confidential contracts in course artifacts.
- Open-source projects, cloud services, AI models, pricing, limits and certification objectives change. Verify official documentation before production use or exam registration.
- Run failure, security, red-team and recovery tests only in approved nonproduction environments with explicit stop conditions.
- Destroy resources, revoke credentials, remove local state and sanitize every portfolio artifact.

Learning Outcomes

- Explain and design the capabilities covered by AI Platform Projects, Interviews and Final Capstone.
- Implement or simulate production workflows through version-controlled automation.
- Test identity, policy, security, reliability, cost and lifecycle behavior.
- Troubleshoot complex failures using a structured evidence-first method.
- Produce sanitized architecture, laboratory, runbook and interview portfolio artifacts.

Table of Contents

- Chapter 56 DataOps Portfolio Project
- Chapter 57 MLOps Lifecycle Project
- Chapter 58 Kubeflow Platform Project
- Chapter 59 Ray Distributed AI Project
- Chapter 60 KServe Production Serving Project
- Chapter 61 RAG and Knowledge Platform Project
- Chapter 62 LLM Evaluation and Observability Project
- Chapter 63 AI Security and Red-Team Project
- Chapter 64 GPU FinOps and Capacity Project
- Chapter 65 AI Platform Migration Project
- Chapter 66 Complex AI Troubleshooting
- Chapter 67 AI and Data Certification Roadmap
- Chapter 68 Senior MLOps and AI Platform Interviews
- Chapter 69 AI Platform Leadership and Product Management
- Chapter 70 Final Enterprise AI Delivery Capstone
- AI Platform Graduation Reference
- Completion Checklist
- Additional Portfolio Projects
- Practice Plan
- Glossary
- Official Documentation Index

Chapter 56: DataOps Portfolio Project

Deliver an owned, tested, observable and governed data product.

Why this chapter matters: DataOps Portfolio Project matters because enterprise outcomes depend on more than a successful tool installation. The team must make deliver an owned, tested, observable and governed data product. explicit, assign ownership, automate repeatable controls, and retain evidence that the design behaves correctly during normal use, denied use and failure.

Learning Objectives

- Explain the purpose, consumers and enterprise trade-offs of dataops portfolio project.
- Design the capability using Kafka, Airflow, dbt, OpenLineage with explicit ownership and failure boundaries.
- Implement a version-controlled workflow with identity, policy, telemetry and lifecycle controls.
- Troubleshoot common failures and produce evidence suitable for operations, security and architecture review.
- Complete the lab: build an end-to-end data product.

Core Concepts

Deliver an owned and problem framing

Deliver an owned and problem framing starts with a clear user or business problem. Define the desired outcome, the actors, the service boundary and the constraints before selecting implementation technology. For dataops portfolio project, record assumptions and the evidence that would disprove them.

tested architecture and operating boundaries

The architecture for tested architecture and operating boundaries must separate control, execution, data and evidence paths. Document trust boundaries, dependencies, quotas, failure domains and who owns each operational decision. Abstraction should reduce repeated work without concealing critical behavior.

observable and governed data product. automation, policy and evidence

Automation for observable and governed data product. automation, policy and evidence must be versioned, reviewed and testable. Include schema validation, policy, dry runs or plans, staged promotion, post-change verification and rollback. Manual emergency actions require an owner, timestamp, reason and expiry.

DataOps Portfolio Project failure handling and continuous improvement

Continuous improvement for dataops portfolio project failure handling and continuous improvement requires observable user outcomes and bounded failure exercises. Test one expected path, one denied path and one dependency failure; then update documentation, alerts and product backlog from the evidence.

Capability and Tool Map

Capability	Tool or pattern	Enterprise use
Primary platform or framework	Kafka	Implement the core capability and define its service contract.
Automation and integration	Airflow	Connect the capability to version-controlled workflows and APIs.
Policy, security or governance	dbt	Constrain behavior with least privilege, validation and exceptions.
Telemetry and operational evidence	OpenLineage	Expose health, usage, audit and user-outcome signals.
Lifecycle and recovery	Kafka	Define upgrade, rollback, backup, restore and deprecation behavior.
Portfolio proof	Airflow	Produce sanitized architecture, test and decision evidence.

Architecture and Operating Decisions

- Start with an explicit consumer outcome and service contract; do not expose a tool merely because it is available.
- Separate control-plane authority from workload execution and minimize the maximum blast radius of credentials, state and change.
- Prefer short-lived identity, immutable artifacts, versioned configuration and automated policy over persistent credentials and console-only workflows.
- Define SLOs, ownership, support, cost allocation, recovery, upgrade and deprecation before broad adoption.
- Preserve an escape hatch with accountable review when the golden path cannot meet a valid requirement.

Reference Service Contract

```
capability: dataops_portfolio_project
owner: platform-or-product-team
consumers: [developer, operator, security, finance]
contract:
  inputs: [request, metadata, policy_context]
  outputs: [resource_or_service, status, evidence]
controls:
  identity: short_lived_and_least_privilege
  policy: versioned_and_tested
  telemetry: metrics_logs_traces_audit
  lifecycle: provision_upgrade_recover_deprecate
validation:
  - approved_path
  - denied_path
  - dependency_failure
  - rollback_or_restore
  - cost_and_ownership_check
volume: 14F
chapter: 56
```

Production Readiness Checklist

- [] Consumers, owner, support tier, lifecycle state and service-level objectives are recorded.
- [] Identity, tenant boundaries, data classification, network paths and secrets are tested.
- [] Configuration and policy are versioned, reviewed, promoted and observable.
- [] Failure, rollback or restore, capacity, quota and dependency behavior have been exercised.
- [] Usage, adoption, user outcomes, cost allocation and exception expiry are measurable.

Troubleshooting Matrix

Symptom	Likely cause	Corrective action	Validation evidence
Request remains pending	Controller, runner or dependency cannot reconcile the desired state	Inspect status conditions, events, queue depth and dependency health; identify the first failing boundary	Successful reconciliation plus latency and audit evidence
User is denied unexpectedly	Identity mapping, policy context or ownership metadata is incomplete	Evaluate effective identity and policy inputs; correct the narrowest cause and rerun denied/allowed tests	Expected allow and deny results with access logs
Change succeeds but user outcome degrades	Technical success criteria do not represent service behavior	Compare SLO, dependency and user-journey signals before and after the change; roll back if needed	Restored SLO and documented causal evidence
Cost or capacity grows unexpectedly	Unbounded defaults, leaks, retries, idle resources or poor allocation	Break down consumption by tenant and unit; apply quota, TTL, scaling or design changes	Reduced unit cost with reliability and quality unchanged

Hands-on Lab 56: Build an end-to-end data product

Prerequisites

- Disposable local or cloud sandbox with budgets and expiry controls.
- Git, containers, Kubernetes or a documented simulation as appropriate.
- Synthetic identities and data only; do not use employer or customer secrets.

Implementation

1. Define fictional requirements, users, ownership and acceptance criteria for dataops portfolio project.
2. Create the smallest safe implementation or detailed simulation using Kafka, Airflow, dbt, OpenLineage.
3. Add identity, policy, metadata, telemetry, quota, cost and lifecycle controls.
4. Run one successful user journey and one intentionally denied action.
5. Inject a bounded dependency or configuration failure, diagnose it, recover and record the timeline.
6. Publish a sanitized architecture, runbook, evidence pack and improvement backlog; then clean up all resources.

Validation Evidence

- Architecture and service contract committed to version control.
- Commands, test results, screenshots or exported telemetry for allow, deny and failure scenarios.
- Recovery, cost, ownership, security and cleanup evidence with timestamps.

Interview Questions and Model Answers

1. How would you design DataOps Portfolio Project?

Begin with consumers, outcomes, constraints and ownership. Define the service contract and failure boundaries, choose the minimum viable architecture, automate policy and lifecycle, then prove normal, denied and recovery behavior.

2. Which trade-offs would you document?

Document speed versus control, abstraction versus transparency, standardization versus flexibility, managed service versus portability, centralization versus team autonomy, and cost versus resilience.

3. What production evidence is required?

Require version-controlled architecture and configuration, effective-access results, policy tests, user-journey telemetry, SLOs, rollback or restore evidence, ownership, cost allocation and a clean teardown or deprecation path.

4. How would you improve adoption?

Use developer research, remove the largest friction, ship a narrow golden path, publish support and escape hatches, measure time-to-value and satisfaction, and iterate with representative product teams.

Chapter Summary

- DataOps Portfolio Project is an owned product or operating capability, not a one-time installation.
- Enterprise readiness requires explicit contracts, boundaries, policy, telemetry and lifecycle controls.
- Adoption and reliability improve when normal, denied and failure behavior are tested with users.
- The lab artifact should show reasoning and evidence, not confidential environment details.

Chapter 57: MLOps Lifecycle Project

Deliver reproducible training, registry, deployment, monitoring and retraining controls.

Why this chapter matters: MLOps Lifecycle Project matters because enterprise outcomes depend on more than a successful tool installation. The team must make deliver reproducible training, registry, deployment, monitoring and retraining controls. explicit, assign ownership, automate repeatable controls, and retain evidence that the design behaves correctly during normal use, denied use and failure.

Learning Objectives

- Explain the purpose, consumers and enterprise trade-offs of mlops lifecycle project.
- Design the capability using MLflow, Feast, CI/CD, KServe with explicit ownership and failure boundaries.
- Implement a version-controlled workflow with identity, policy, telemetry and lifecycle controls.
- Troubleshoot common failures and produce evidence suitable for operations, security and architecture review.
- Complete the lab: build a production mlops project.

Core Concepts

Deliver reproducible training and problem framing

Deliver reproducible training and problem framing starts with a clear user or business problem. Define the desired outcome, the actors, the service boundary and the constraints before selecting implementation technology. For mlops lifecycle project, record assumptions and the evidence that would disprove them.

registry architecture and operating boundaries

The architecture for registry architecture and operating boundaries must separate control, execution, data and evidence paths. Document trust boundaries, dependencies, quotas, failure domains and who owns each operational decision. Abstraction should reduce repeated work without concealing critical behavior.

deployment automation, policy and evidence

Automation for deployment automation, policy and evidence must be versioned, reviewed and testable. Include schema validation, policy, dry runs or plans, staged promotion, post-change verification and rollback. Manual emergency actions require an owner, timestamp, reason and expiry.

monitoring and retraining controls. failure handling and continuous improvement

Continuous improvement for monitoring and retraining controls. failure handling and continuous improvement requires observable user outcomes and bounded failure exercises. Test one expected path, one denied path and one dependency failure; then update documentation, alerts and product backlog from the evidence.

Capability and Tool Map

Capability	Tool or pattern	Enterprise use
Primary platform or framework	MLflow	Implement the core capability and define its service contract.
Automation and integration	Feast	Connect the capability to version-controlled workflows and APIs.
Policy, security or governance	CI/CD	Constrain behavior with least privilege, validation and exceptions.
Telemetry and operational evidence	KServe	Expose health, usage, audit and user-outcome signals.
Lifecycle and recovery	MLflow	Define upgrade, rollback, backup, restore and deprecation behavior.
Portfolio proof	Feast	Produce sanitized architecture, test and decision evidence.

Architecture and Operating Decisions

- Start with an explicit consumer outcome and service contract; do not expose a tool merely because it is available.
- Separate control-plane authority from workload execution and minimize the maximum blast radius of credentials, state and change.
- Prefer short-lived identity, immutable artifacts, versioned configuration and automated policy over persistent credentials and console-only workflows.
- Define SLOs, ownership, support, cost allocation, recovery, upgrade and deprecation before broad adoption.
- Preserve an escape hatch with accountable review when the golden path cannot meet a valid requirement.

Reference Service Contract

```
capability: mlops_lifecycle_project
owner: platform-or-product-team
consumers: [developer, operator, security, finance]
contract:
  inputs: [request, metadata, policy_context]
  outputs: [resource_or_service, status, evidence]
controls:
  identity: short_lived_and_least_privilege

  telemetry: metrics_logs_traces_audit
  lifecycle: provision_upgrade_recover_deprecate
validation:
  - approved_path
  - denied_path
  - dependency_failure
  - rollback_or_restore
  - cost_and_ownership_check
volume: 14F
chapter: 57
```

Production Readiness Checklist

- [] Consumers, owner, support tier, lifecycle state and service-level objectives are recorded.
- [] Identity, tenant boundaries, data classification, network paths and secrets are tested.
- [] Configuration and policy are versioned, reviewed, promoted and observable.
- [] Failure, rollback or restore, capacity, quota and dependency behavior have been exercised.
- [] Usage, adoption, user outcomes, cost allocation and exception expiry are measurable.

Troubleshooting Matrix

Symptom	Likely cause	Corrective action	Validation evidence
Request remains pending	Controller, runner or dependency cannot reconcile the desired state	Inspect status conditions, events, queue depth and dependency health; identify the first failing boundary	Successful reconciliation plus latency and audit evidence
User is denied unexpectedly	Identity mapping, policy context or ownership metadata is incomplete	Evaluate effective identity and policy inputs; correct the narrowest cause and rerun denied/allowed tests	Expected allow and deny results with access logs
Change succeeds but user outcome degrades	Technical success criteria do not represent service behavior	Compare SLO, dependency and user-journey signals before and after the change; roll back if needed	Restored SLO and documented causal evidence
Cost or capacity grows unexpectedly	Unbounded defaults, leaks, retries, idle resources or poor allocation	Break down consumption by tenant and unit; apply quota, TTL, scaling or design changes	Reduced unit cost with reliability and quality unchanged

Hands-on Lab 57: Build a production MLOps project

Prerequisites

- Disposable local or cloud sandbox with budgets and expiry controls.
- Git, containers, Kubernetes or a documented simulation as appropriate.
- Synthetic identities and data only; do not use employer or customer secrets.

Implementation

1. Define fictional requirements, users, ownership and acceptance criteria for mlops lifecycle project.
2. Create the smallest safe implementation or detailed simulation using MLflow, Feast, CI/CD, KServe.
3. Add identity, policy, metadata, telemetry, quota, cost and lifecycle controls.
4. Run one successful user journey and one intentionally denied action.
5. Inject a bounded dependency or configuration failure, diagnose it, recover and record the timeline.
6. Publish a sanitized architecture, runbook, evidence pack and improvement backlog; then clean up all resources.

Validation Evidence

- Architecture and service contract committed to version control.
- Commands, test results, screenshots or exported telemetry for allow, deny and failure scenarios.
- Recovery, cost, ownership, security and cleanup evidence with timestamps.

Interview Questions and Model Answers

1. How would you design MLOps Lifecycle Project?

Begin with consumers, outcomes, constraints and ownership. Define the service contract and failure boundaries, choose the minimum viable architecture, automate policy and lifecycle, then prove normal, denied and recovery behavior.

2. Which trade-offs would you document?

Document speed versus control, abstraction versus transparency, standardization versus flexibility, managed service versus portability, centralization versus team autonomy, and cost versus resilience.

3. What production evidence is required?

Require version-controlled architecture and configuration, effective-access results, policy tests, user-journey telemetry, SLOs, rollback or restore evidence, ownership, cost allocation and a clean teardown or deprecation path.

4. How would you improve adoption?

Use developer research, remove the largest friction, ship a narrow golden path, publish support and escape hatches, measure time-to-value and satisfaction, and iterate with representative product teams.

Chapter Summary

- MLOps Lifecycle Project is an owned product or operating capability, not a one-time installation.
- Enterprise readiness requires explicit contracts, boundaries, policy, telemetry and lifecycle controls.
- Adoption and reliability improve when normal, denied and failure behavior are tested with users.
- The lab artifact should show reasoning and evidence, not confidential environment details.

Chapter 58: Kubeflow Platform Project

Deliver notebooks, pipelines, training and tenant controls on Kubernetes.

Why this chapter matters: Kubeflow Platform Project matters because enterprise outcomes depend on more than a successful tool installation. The team must make deliver notebooks, pipelines, training and tenant controls on kubernetes. explicit, assign ownership, automate repeatable controls, and retain evidence that the design behaves correctly during normal use, denied use and failure.

Learning Objectives

- Explain the purpose, consumers and enterprise trade-offs of kubeflow platform project.
- Design the capability using Kubeflow, Kubernetes, GitOps with explicit ownership and failure boundaries.
- Implement a version-controlled workflow with identity, policy, telemetry and lifecycle controls.
- Troubleshoot common failures and produce evidence suitable for operations, security and architecture review.
- Complete the lab: build a kubeflow reference platform.

Core Concepts

Deliver notebooks and problem framing

Deliver notebooks and problem framing starts with a clear user or business problem. Define the desired outcome, the actors, the service boundary and the constraints before selecting implementation technology. For kubeflow platform project, record assumptions and the evidence that would disprove them.

pipelines architecture and operating boundaries

The architecture for pipelines architecture and operating boundaries must separate control, execution, data and evidence paths. Document trust boundaries, dependencies, quotas, failure domains and who owns each operational decision. Abstraction should reduce repeated work without concealing critical behavior.

training and tenant controls on Kubernetes. automation, policy and evidence

Automation for training and tenant controls on kubernetes. automation, policy and evidence must be versioned, reviewed and testable. Include schema validation, policy, dry runs or plans, staged promotion, post-change verification and rollback. Manual emergency actions require an owner, timestamp, reason and expiry.

Kubeflow Platform Project failure handling and continuous improvement

Continuous improvement for kubeflow platform project failure handling and continuous improvement requires observable user outcomes and bounded failure exercises. Test one expected path, one denied path and one dependency failure; then update documentation, alerts and product backlog from the evidence.

Capability and Tool Map

Capability	Tool or pattern	Enterprise use
Primary platform or framework	Kubeflow	Implement the core capability and define its service contract.
Automation and integration	Kubernetes	Connect the capability to version-controlled workflows and APIs.
Policy, security or governance	GitOps	Constrain behavior with least privilege, validation and exceptions.
Telemetry and operational evidence	Kubeflow	Expose health, usage, audit and user-outcome signals.
Lifecycle and recovery	Kubernetes	Define upgrade, rollback, backup, restore and deprecation behavior.
Portfolio proof	GitOps	Produce sanitized architecture, test and decision evidence.

Architecture and Operating Decisions

- Start with an explicit consumer outcome and service contract; do not expose a tool merely because it is available.
- Separate control-plane authority from workload execution and minimize the maximum blast radius of credentials, state and change.
- Prefer short-lived identity, immutable artifacts, versioned configuration and automated policy over persistent credentials and console-only workflows.
- Define SLOs, ownership, support, cost allocation, recovery, upgrade and deprecation before broad adoption.
- Preserve an escape hatch with accountable review when the golden path cannot meet a valid requirement.

Reference Service Contract

Validation Evidence

- Architecture and service contract committed to version control.
- Commands, test results, screenshots or exported telemetry for allow, deny and failure scenarios.
- Recovery, cost, ownership, security and cleanup evidence with timestamps.

Interview Questions and Model Answers

1. How would you design Kubeflow Platform Project?

Begin with consumers, outcomes, constraints and ownership. Define the service contract and failure boundaries, choose the minimum viable architecture, automate policy and lifecycle, then prove normal, denied and recovery behavior.

2. Which trade-offs would you document?

Document speed versus control, abstraction versus transparency, standardization versus flexibility, managed service versus portability, centralization versus team autonomy, and cost versus resilience.

3. What production evidence is required?

Require version-controlled architecture and configuration, effective-access results, policy tests, user-journey telemetry, SLOs, rollback or restore evidence, ownership, cost allocation and a clean teardown or deprecation path.

4. How would you improve adoption?

Use developer research, remove the largest friction, ship a narrow golden path, publish support and escape hatches, measure time-to-value and satisfaction, and iterate with representative product teams.

Chapter Summary

- Kubeflow Platform Project is an owned product or operating capability, not a one-time installation.
- Enterprise readiness requires explicit contracts, boundaries, policy, telemetry and lifecycle controls.
- Adoption and reliability improve when normal, denied and failure behavior are tested with users.
- The lab artifact should show reasoning and evidence, not confidential environment details.

Chapter 59: Ray Distributed AI Project

Deliver scalable data, training and serving with recovery and observability.

Why this chapter matters: Ray Distributed AI Project matters because enterprise outcomes depend on more than a successful tool installation. The team must make deliver scalable data, training and serving with recovery and observability. explicit, assign ownership, automate repeatable controls, and retain evidence that the design behaves correctly during normal use, denied use and failure.

Learning Objectives

- Explain the purpose, consumers and enterprise trade-offs of ray distributed ai project.
- Design the capability using Ray Data, Ray Train, Ray Serve, KubeRay with explicit ownership and failure boundaries.
- Implement a version-controlled workflow with identity, policy, telemetry and lifecycle controls.
- Troubleshoot common failures and produce evidence suitable for operations, security and architecture review.
- Complete the lab: build a ray-based ai service.

Core Concepts

Deliver scalable data and problem framing

Deliver scalable data and problem framing starts with a clear user or business problem. Define the desired outcome, the actors, the service boundary and the constraints before selecting implementation technology. For ray distributed ai project, record assumptions and the evidence that would disprove them.

training and serving with recovery and observability. architecture and operating boundaries

The architecture for training and serving with recovery and observability. architecture and operating boundaries must separate control, execution, data and evidence paths. Document trust boundaries, dependencies, quotas, failure domains and who owns each operational decision. Abstraction should reduce repeated work without concealing critical behavior.

Ray Distributed AI Project automation, policy and evidence

Automation for ray distributed ai project automation, policy and evidence must be versioned, reviewed and testable. Include schema validation, policy, dry runs or plans, staged promotion, post-change verification and rollback. Manual emergency actions require an owner, timestamp, reason and expiry.

Ray Distributed AI Project failure handling and continuous improvement

Continuous improvement for ray distributed ai project failure handling and continuous improvement requires observable user outcomes and bounded failure exercises. Test one expected path, one denied path and one dependency failure; then update documentation, alerts and product backlog from the evidence.

Capability and Tool Map

Capability	Tool or pattern	Enterprise use
Primary platform or framework	Ray Data	Implement the core capability and define its service contract.
Automation and integration	Ray Train	Connect the capability to version-controlled workflows and APIs.
Policy, security or governance	Ray Serve	Constrain behavior with least privilege, validation and exceptions.
Telemetry and operational evidence	KubeRay	Expose health, usage, audit and user-outcome signals.
Lifecycle and recovery	Ray Data	Define upgrade, rollback, backup, restore and deprecation behavior.

Capability	Tool or pattern	Enterprise use
Portfolio proof	Ray Train	Produce sanitized architecture, test and decision evidence.

Architecture and Operating Decisions

- Start with an explicit consumer outcome and service contract; do not expose a tool merely because it is available.
- Separate control-plane authority from workload execution and minimize the maximum blast radius of credentials, state and change.
- Prefer short-lived identity, immutable artifacts, versioned configuration and automated policy over persistent credentials and console-only workflows.
- Define SLOs, ownership, support, cost allocation, recovery, upgrade and deprecation before broad adoption.
- Preserve an escape hatch with accountable review when the golden path cannot meet a valid requirement.

Hands-on Lab 59: Build a Ray-based AI service

Prerequisites

- Disposable local or cloud sandbox with budgets and expiry controls.
- Git, containers, Kubernetes or a documented simulation as appropriate.
- Synthetic identities and data only; do not use employer or customer secrets.

Implementation

1. Define fictional requirements, users, ownership and acceptance criteria for ray distributed ai project.
2. Create the smallest safe implementation or detailed simulation using Ray Data, Ray Train, Ray Serve, KubeRay.
3. Add identity, policy, metadata, telemetry, quota, cost and lifecycle controls.
4. Run one successful user journey and one intentionally denied action.
5. Inject a bounded dependency or configuration failure, diagnose it, recover and record the timeline.
6. Publish a sanitized architecture, runbook, evidence pack and improvement backlog; then clean up all resources.

Validation Evidence

- Architecture and service contract committed to version control.
- Commands, test results, screenshots or exported telemetry for allow, deny and failure scenarios.
- Recovery, cost, ownership, security and cleanup evidence with timestamps.

Interview Questions and Model Answers

1. How would you design Ray Distributed AI Project?

Begin with consumers, outcomes, constraints and ownership. Define the service contract and failure boundaries, choose the minimum viable architecture, automate policy and lifecycle, then prove normal, denied and recovery behavior.

2. Which trade-offs would you document?

Document speed versus control, abstraction versus transparency, standardization versus flexibility, managed service versus portability, centralization versus team autonomy, and cost versus resilience.

3. What production evidence is required?

Require version-controlled architecture and configuration, effective-access results, policy tests, user-journey telemetry, SLOs, rollback or restore evidence, ownership, cost allocation and a clean teardown or deprecation path.

4. How would you improve adoption?

Use developer research, remove the largest friction, ship a narrow golden path, publish support and escape hatches, measure time-to-value and satisfaction, and iterate with representative product teams.

Chapter Summary

- Ray Distributed AI Project is an owned product or operating capability, not a one-time installation.
- Enterprise readiness requires explicit contracts, boundaries, policy, telemetry and lifecycle controls.
- Adoption and reliability improve when normal, denied and failure behavior are tested with users.
- The lab artifact should show reasoning and evidence, not confidential environment details.

Chapter 60: KServe Production Serving Project

Deliver canary, autoscaling, explainability, monitoring and rollback.

Why this chapter matters: KServe Production Serving Project matters because enterprise outcomes depend on more than a successful tool installation. The team must make deliver canary, autoscaling, explainability, monitoring and rollback. explicit, assign ownership, automate repeatable controls, and retain evidence that the design behaves correctly during normal use, denied use and failure.

Learning Objectives

- Explain the purpose, consumers and enterprise trade-offs of kserve production serving project.
- Design the capability using KServe, Knative, Prometheus with explicit ownership and failure boundaries.
- Implement a version-controlled workflow with identity, policy, telemetry and lifecycle controls.
- Troubleshoot common failures and produce evidence suitable for operations, security and architecture review.
- Complete the lab: build a production inference endpoint.

Core Concepts

Deliver canary and problem framing

Deliver canary and problem framing starts with a clear user or business problem. Define the desired outcome, the actors, the service boundary and the constraints before selecting implementation technology. For kserve production serving project, record assumptions and the evidence that would disprove them.

autoscaling architecture and operating boundaries

The architecture for autoscaling architecture and operating boundaries must separate control, execution, data and evidence paths. Document trust boundaries, dependencies, quotas, failure domains and who owns each operational decision. Abstraction should reduce repeated work without concealing critical behavior.

explainability automation, policy and evidence

Automation for explainability automation, policy and evidence must be versioned, reviewed and testable. Include schema validation, policy, dry runs or plans, staged promotion, post-change verification and rollback. Manual emergency actions require an owner, timestamp, reason and expiry.

monitoring and rollback. failure handling and continuous improvement

Continuous improvement for monitoring and rollback. failure handling and continuous improvement requires observable user outcomes and bounded failure exercises. Test one expected path, one denied path and one dependency failure; then update documentation, alerts and product backlog from the evidence.

Capability and Tool Map

Capability	Tool or pattern	Enterprise use
Primary platform or framework	KServe	Implement the core capability and define its service contract.
Automation and integration	Knative	Connect the capability to version-controlled workflows and APIs.
Policy, security or governance	Prometheus	Constrain behavior with least privilege, validation and exceptions.
Telemetry and operational evidence	KServe	Expose health, usage, audit and user-outcome signals.
Lifecycle and recovery	Knative	Define upgrade, rollback, backup, restore and deprecation behavior.
Portfolio proof	Prometheus	Produce sanitized architecture, test and decision evidence.

Architecture and Operating Decisions

- Start with an explicit consumer outcome and service contract; do not expose a tool merely because it is available.
- Separate control-plane authority from workload execution and minimize the maximum blast radius of credentials, state and change.
- Prefer short-lived identity, immutable artifacts, versioned configuration and automated policy over persistent credentials and console-only workflows.
- Define SLOs, ownership, support, cost allocation, recovery, upgrade and deprecation before broad adoption.
- Preserve an escape hatch with accountable review when the golden path cannot meet a valid requirement.

Reference Service Contract

```
capability: kserve_production_serving_projec
owner: platform-or-product-team
consumers: [developer, operator, security, finance]
contract:
  inputs: [request, metadata, policy_context]
  outputs: [resource_or_service, status, evidence]
controls:
  identity: short_lived_and_least_privilege
  policy: versioned_and_tested
  telemetry: metrics_logs_traces_audit
  lifecycle: provision_upgrade_recover_deprecate
validation:
  - approved_path
  - denied_path
  - dependency_failure
  - rollback_or_restore
  - cost_and_ownership_check
volume: 14F
chapter: 60
```

Production Readiness Checklist

- [] Consumers, owner, support tier, lifecycle state and service-level objectives are recorded.
- [] Identity, tenant boundaries, data classification, network paths and secrets are tested.
- [] Configuration and policy are versioned, reviewed, promoted and observable.
- [] Failure, rollback or restore, capacity, quota and dependency behavior have been exercised.
- [] Usage, adoption, user outcomes, cost allocation and exception expiry are measurable.

Troubleshooting Matrix

Symptom	Likely cause	Corrective action	Validation evidence
Request remains pending	Controller, runner or dependency cannot reconcile the desired state	Inspect status conditions, events, queue depth and dependency health; identify the first failing boundary	Successful reconciliation plus latency and audit evidence
User is denied unexpectedly	Identity mapping, policy context or ownership metadata is incomplete	Evaluate effective identity and policy inputs; correct the narrowest cause and rerun denied/allowed tests	Expected allow and deny results with access logs
Change succeeds but user outcome degrades	Technical success criteria do not represent service behavior	Compare SLO, dependency and user-journey signals before and after the change; roll back if needed	Restored SLO and documented causal evidence
Cost or capacity grows unexpectedly	Unbounded defaults, leaks, retries, idle resources or poor allocation	Break down consumption by tenant and unit; apply quota, TTL, scaling or design changes	Reduced unit cost with reliability and quality unchanged

Hands-on Lab 60: Build a production inference endpoint

Prerequisites

- Disposable local or cloud sandbox with budgets and expiry controls.
- Git, containers, Kubernetes or a documented simulation as appropriate.
- Synthetic identities and data only; do not use employer or customer secrets.

Implementation

1. Define fictional requirements, users, ownership and acceptance criteria for kserve production serving project.
2. Create the smallest safe implementation or detailed simulation using KServe, Knative, Prometheus.
3. Add identity, policy, metadata, telemetry, quota, cost and lifecycle controls.
4. Run one successful user journey and one intentionally denied action.
5. Inject a bounded dependency or configuration failure, diagnose it, recover and record the timeline.
6. Publish a sanitized architecture, runbook, evidence pack and improvement backlog; then clean up all resources.

Validation Evidence

- Architecture and service contract committed to version control.
- Commands, test results, screenshots or exported telemetry for allow, deny and failure scenarios.
- Recovery, cost, ownership, security and cleanup evidence with timestamps.

Interview Questions and Model Answers

1. How would you design KServe Production Serving Project?

Begin with consumers, outcomes, constraints and ownership. Define the service contract and failure boundaries, choose the minimum viable architecture, automate policy and lifecycle, then prove normal, denied and recovery behavior.

2. Which trade-offs would you document?

Document speed versus control, abstraction versus transparency, standardization versus flexibility, managed service versus portability, centralization versus team autonomy, and cost versus resilience.

3. What production evidence is required?

Require version-controlled architecture and configuration, effective-access results, policy tests, user-journey telemetry, SLOs, rollback or restore evidence, ownership, cost allocation and a clean teardown or deprecation path.

4. How would you improve adoption?

Use developer research, remove the largest friction, ship a narrow golden path, publish support and escape hatches, measure time-to-value and satisfaction, and iterate with representative product teams.

Chapter Summary

- KServe Production Serving Project is an owned product or operating capability, not a one-time installation.
- Enterprise readiness requires explicit contracts, boundaries, policy, telemetry and lifecycle controls.
- Adoption and reliability improve when normal, denied and failure behavior are tested with users.
- The lab artifact should show reasoning and evidence, not confidential environment details.

Chapter 61: RAG and Knowledge Platform Project

Deliver ingestion, retrieval, citations, evaluation, security and freshness.

Why this chapter matters: RAG and Knowledge Platform Project matters because enterprise outcomes depend on more than a successful tool installation. The team must make deliver ingestion, retrieval, citations, evaluation, security and freshness. explicit, assign ownership, automate repeatable controls, and retain evidence that the design behaves correctly during normal use, denied use and failure.

Learning Objectives

- Explain the purpose, consumers and enterprise trade-offs of rag and knowledge platform project.
- Design the capability using Vector database, embeddings, LLM gateway with explicit ownership and failure boundaries.
- Implement a version-controlled workflow with identity, policy, telemetry and lifecycle controls.
- Troubleshoot common failures and produce evidence suitable for operations, security and architecture review.
- Complete the lab: build and evaluate a governed rag system.

Core Concepts

Deliver ingestion and problem framing

Deliver ingestion and problem framing starts with a clear user or business problem. Define the desired outcome, the actors, the service boundary and the constraints before selecting implementation technology. For rag and knowledge platform project, record assumptions and the evidence that would disprove them.

retrieval architecture and operating boundaries

The architecture for retrieval architecture and operating boundaries must separate control, execution, data and evidence paths. Document trust boundaries, dependencies, quotas, failure domains and who owns each operational decision. Abstraction should reduce repeated work without concealing critical behavior.

citations automation, policy and evidence

Automation for citations automation, policy and evidence must be versioned, reviewed and testable. Include schema validation, policy, dry runs or plans, staged promotion, post-change verification and rollback. Manual emergency actions require an owner, timestamp, reason and expiry.

evaluation failure handling and continuous improvement

Continuous improvement for evaluation failure handling and continuous improvement requires observable user outcomes and bounded failure exercises. Test one expected path, one denied path and one dependency failure; then update documentation, alerts and product backlog from the evidence.

Capability and Tool Map

Capability	Tool or pattern	Enterprise use
Primary platform or framework	Vector database	Implement the core capability and define its service contract.
Automation and integration	embeddings	Connect the capability to version-controlled workflows and APIs.
Policy, security or governance	LLM gateway	Constrain behavior with least privilege, validation and exceptions.
Telemetry and operational evidence	Vector database	Expose health, usage, audit and user-outcome signals.
Lifecycle and recovery	embeddings	Define upgrade, rollback, backup, restore and deprecation behavior.

Capability	Tool or pattern	Enterprise use
Portfolio proof	LLM gateway	Produce sanitized architecture, test and decision evidence.

Architecture and Operating Decisions

- Start with an explicit consumer outcome and service contract; do not expose a tool merely because it is available.
- Separate control-plane authority from workload execution and minimize the maximum blast radius of credentials, state and change.
- Prefer short-lived identity, immutable artifacts, versioned configuration and automated policy over persistent credentials and console-only workflows.
- Define SLOs, ownership, support, cost allocation, recovery, upgrade and deprecation before broad adoption.
- Preserve an escape hatch with accountable review when the golden path cannot meet a valid requirement.

Chapter Summary

- RAG and Knowledge Platform Project is an owned product or operating capability, not a one-time installation.
- Enterprise readiness requires explicit contracts, boundaries, policy, telemetry and lifecycle controls.
- Adoption and reliability improve when normal, denied and failure behavior are tested with users.
- The lab artifact should show reasoning and evidence, not confidential environment details.

Chapter 62: LLM Evaluation and Observability Project

Create datasets, scorers, traces, dashboards and release criteria.

Why this chapter matters: LLM Evaluation and Observability Project matters because enterprise outcomes depend on more than a successful tool installation. The team must make create datasets, scorers, traces, dashboards and release criteria. explicit, assign ownership, automate repeatable controls, and retain evidence that the design behaves correctly during normal use, denied use and failure.

Learning Objectives

- Explain the purpose, consumers and enterprise trade-offs of llm evaluation and observability project.
- Design the capability using MLflow GenAI, OpenTelemetry, dashboards with explicit ownership and failure boundaries.
- Implement a version-controlled workflow with identity, policy, telemetry and lifecycle controls.
- Troubleshoot common failures and produce evidence suitable for operations, security and architecture review.
- Complete the lab: build an llm quality gate.

Core Concepts

Create datasets and problem framing

Create datasets and problem framing starts with a clear user or business problem. Define the desired outcome, the actors, the service boundary and the constraints before selecting implementation technology. For llm evaluation and observability project, record assumptions and the evidence that would disprove them.

scorers architecture and operating boundaries

The architecture for scorers architecture and operating boundaries must separate control, execution, data and evidence paths. Document trust boundaries, dependencies, quotas, failure domains and who owns each operational decision. Abstraction should reduce repeated work without concealing critical behavior.

traces automation, policy and evidence

Automation for traces automation, policy and evidence must be versioned, reviewed and testable. Include schema validation, policy, dry runs or plans, staged promotion, post-change verification and rollback. Manual emergency actions require an owner, timestamp, reason and expiry.

dashboards and release criteria. failure handling and continuous improvement

Continuous improvement for dashboards and release criteria. failure handling and continuous improvement requires observable user outcomes and bounded failure exercises. Test one expected path, one denied path and one dependency failure; then update documentation, alerts and product backlog from the evidence.

Capability and Tool Map

Capability	Tool or pattern	Enterprise use
Primary platform or framework	MLflow GenAI	Implement the core capability and define its service contract.
Automation and integration	OpenTelemetry	Connect the capability to version-controlled workflows and APIs.
Policy, security or governance	dashboards	Constrain behavior with least privilege, validation and exceptions.
Telemetry and operational evidence	MLflow GenAI	Expose health, usage, audit and user-outcome signals.
Lifecycle and recovery	OpenTelemetry	Define upgrade, rollback, backup, restore and deprecation behavior.

Capability	Tool or pattern	Enterprise use
Portfolio proof	dashboards	Produce sanitized architecture, test and decision evidence.

Architecture and Operating Decisions

- Start with an explicit consumer outcome and service contract; do not expose a tool merely because it is available.
- Separate control-plane authority from workload execution and minimize the maximum blast radius of credentials, state and change.
- Prefer short-lived identity, immutable artifacts, versioned configuration and automated policy over persistent credentials and console-only workflows.
- Define SLOs, ownership, support, cost allocation, recovery, upgrade and deprecation before broad adoption.
- Preserve an escape hatch with accountable review when the golden path cannot meet a valid requirement.

Chapter Summary

- LLM Evaluation and Observability Project is an owned product or operating capability, not a one-time installation.
- Enterprise readiness requires explicit contracts, boundaries, policy, telemetry and lifecycle controls.
- Adoption and reliability improve when normal, denied and failure behavior are tested with users.
- The lab artifact should show reasoning and evidence, not confidential environment details.

Chapter 63: AI Security and Red-Team Project

Test prompt injection, tool abuse, data exposure, model endpoints and supply chain.

Why this chapter matters: AI Security and Red-Team Project matters because enterprise outcomes depend on more than a successful tool installation. The team must make test prompt injection, tool abuse, data exposure, model endpoints and supply chain. explicit, assign ownership, automate repeatable controls, and retain evidence that the design behaves correctly during normal use, denied use and failure.

Learning Objectives

- Explain the purpose, consumers and enterprise trade-offs of ai security and red-team project.
- Design the capability using Threat modeling, adversarial tests, policy with explicit ownership and failure boundaries.
- Implement a version-controlled workflow with identity, policy, telemetry and lifecycle controls.
- Troubleshoot common failures and produce evidence suitable for operations, security and architecture review.
- Complete the lab: run an ai security assessment.

Core Concepts

Test prompt injection and problem framing

Test prompt injection and problem framing starts with a clear user or business problem. Define the desired outcome, the actors, the service boundary and the constraints before selecting implementation technology. For ai security and red-team project, record assumptions and the evidence that would disprove them.

tool abuse architecture and operating boundaries

The architecture for tool abuse architecture and operating boundaries must separate control, execution, data and evidence paths. Document trust boundaries, dependencies, quotas, failure domains and who owns each operational decision. Abstraction should reduce repeated work without concealing critical behavior.

data exposure automation, policy and evidence

Automation for data exposure automation, policy and evidence must be versioned, reviewed and testable. Include schema validation, policy, dry runs or plans, staged promotion, post-change verification and rollback. Manual emergency actions require an owner, timestamp, reason and expiry.

model endpoints and supply chain. failure handling and continuous improvement

Continuous improvement for model endpoints and supply chain. failure handling and continuous improvement requires observable user outcomes and bounded failure exercises. Test one expected path, one denied path and one dependency failure; then update documentation, alerts and product backlog from the evidence.

Capability and Tool Map

Capability	Tool or pattern	Enterprise use
Primary platform or framework	Threat modeling	Implement the core capability and define its service contract.
Automation and integration	adversarial tests	Connect the capability to version-controlled workflows and APIs.
Policy, security or governance	policy	Constrain behavior with least privilege, validation and exceptions.
Telemetry and operational evidence	Threat modeling	Expose health, usage, audit and user-outcome signals.
Lifecycle and recovery	adversarial tests	Define upgrade, rollback, backup, restore and deprecation behavior.

Capability	Tool or pattern	Enterprise use
Portfolio proof	policy	Produce sanitized architecture, test and decision evidence.

Architecture and Operating Decisions

- Start with an explicit consumer outcome and service contract; do not expose a tool merely because it is available.
- Separate control-plane authority from workload execution and minimize the maximum blast radius of credentials, state and change.
- Prefer short-lived identity, immutable artifacts, versioned configuration and automated policy over persistent credentials and console-only workflows.
- Define SLOs, ownership, support, cost allocation, recovery, upgrade and deprecation before broad adoption.
- Preserve an escape hatch with accountable review when the golden path cannot meet a valid requirement.

Chapter Summary

- AI Security and Red-Team Project is an owned product or operating capability, not a one-time installation.
- Enterprise readiness requires explicit contracts, boundaries, policy, telemetry and lifecycle controls.
- Adoption and reliability improve when normal, denied and failure behavior are tested with users.
- The lab artifact should show reasoning and evidence, not confidential environment details.

Chapter 64: GPU FinOps and Capacity Project

Optimize accelerator utilization without degrading delivery or reliability.

Why this chapter matters: GPU FinOps and Capacity Project matters because enterprise outcomes depend on more than a successful tool installation. The team must make optimize accelerator utilization without degrading delivery or reliability. explicit, assign ownership, automate repeatable controls, and retain evidence that the design behaves correctly during normal use, denied use and failure.

Learning Objectives

- Explain the purpose, consumers and enterprise trade-offs of gpu finops and capacity project.
- Design the capability using DCGM, billing data, schedulers with explicit ownership and failure boundaries.
- Implement a version-controlled workflow with identity, policy, telemetry and lifecycle controls.
- Troubleshoot common failures and produce evidence suitable for operations, security and architecture review.
- Complete the lab: build a gpu capacity and value report.

Core Concepts

Optimize accelerator utilization without degrading delivery or reliability. and problem framing

Optimize accelerator utilization without degrading delivery or reliability. and problem framing starts with a clear user or business problem. Define the desired outcome, the actors, the service boundary and the constraints before selecting implementation technology. For gpu finops and capacity project, record assumptions and the evidence that would disprove them.

GPU FinOps and Capacity Project architecture and operating boundaries

The architecture for gpu finops and capacity project architecture and operating boundaries must separate control, execution, data and evidence paths. Document trust boundaries, dependencies, quotas, failure domains and who owns each operational decision. Abstraction should reduce repeated work without concealing critical behavior.

GPU FinOps and Capacity Project automation, policy and evidence

Automation for gpu finops and capacity project automation, policy and evidence must be versioned, reviewed and testable. Include schema validation, policy, dry runs or plans, staged promotion, post-change verification and rollback. Manual emergency actions require an owner, timestamp, reason and expiry.

GPU FinOps and Capacity Project failure handling and continuous improvement

Continuous improvement for gpu finops and capacity project failure handling and continuous improvement requires observable user outcomes and bounded failure exercises. Test one expected path, one denied path and one dependency failure; then update documentation, alerts and product backlog from the evidence.

Capability and Tool Map

Capability	Tool or pattern	Enterprise use
Primary platform or framework	DCGM	Implement the core capability and define its service contract.
Automation and integration	billing data	Connect the capability to version-controlled workflows and APIs.
Policy, security or governance	schedulers	Constrain behavior with least privilege, validation and exceptions.
Telemetry and operational evidence	DCGM	Expose health, usage, audit and user-outcome signals.
Lifecycle and recovery	billing data	Define upgrade, rollback, backup, restore and deprecation behavior.

Capability	Tool or pattern	Enterprise use
Portfolio proof	schedulers	Produce sanitized architecture, test and decision evidence.

Architecture and Operating Decisions

- Start with an explicit consumer outcome and service contract; do not expose a tool merely because it is available.
- Separate control-plane authority from workload execution and minimize the maximum blast radius of credentials, state and change.
- Prefer short-lived identity, immutable artifacts, versioned configuration and automated policy over persistent credentials and console-only workflows.
- Define SLOs, ownership, support, cost allocation, recovery, upgrade and deprecation before broad adoption.
- Preserve an escape hatch with accountable review when the golden path cannot meet a valid requirement.

- Architecture and service contract committed to version control.
- Commands, test results, screenshots or exported telemetry for allow, deny and failure scenarios.
- Recovery, cost, ownership, security and cleanup evidence with timestamps.

Interview Questions and Model Answers

1. How would you design GPU FinOps and Capacity Project?

Begin with consumers, outcomes, constraints and ownership. Define the service contract and failure boundaries, choose the minimum viable architecture, automate policy and lifecycle, then prove normal, denied and recovery behavior.

2. Which trade-offs would you document?

Document speed versus control, abstraction versus transparency, standardization versus flexibility, managed service versus portability, centralization versus team autonomy, and cost versus resilience.

3. What production evidence is required?

Require version-controlled architecture and configuration, effective-access results, policy tests, user-journey telemetry, SLOs, rollback or restore evidence, ownership, cost allocation and a clean teardown or deprecation path.

4. How would you improve adoption?

Use developer research, remove the largest friction, ship a narrow golden path, publish support and escape hatches, measure time-to-value and satisfaction, and iterate with representative product teams.

Chapter Summary

- GPU FinOps and Capacity Project is an owned product or operating capability, not a one-time installation.
- Enterprise readiness requires explicit contracts, boundaries, policy, telemetry and lifecycle controls.
- Adoption and reliability improve when normal, denied and failure behavior are tested with users.
- The lab artifact should show reasoning and evidence, not confidential environment details.

Chapter 65: AI Platform Migration Project

Move notebooks, pipelines, models and endpoints with lineage and rollback.

Why this chapter matters: AI Platform Migration Project matters because enterprise outcomes depend on more than a successful tool installation. The team must make move notebooks, pipelines, models and endpoints with lineage and rollback. explicit, assign ownership, automate repeatable controls, and retain evidence that the design behaves correctly during normal use, denied use and failure.

Learning Objectives

- Explain the purpose, consumers and enterprise trade-offs of ai platform migration project.
- Design the capability using Migration waves, adapters, dual run with explicit ownership and failure boundaries.
- Implement a version-controlled workflow with identity, policy, telemetry and lifecycle controls.
- Troubleshoot common failures and produce evidence suitable for operations, security and architecture review.
- Complete the lab: plan and simulate an ai platform migration.

Core Concepts

Move notebooks and problem framing

Move notebooks and problem framing starts with a clear user or business problem. Define the desired outcome, the actors, the service boundary and the constraints before selecting implementation technology. For ai platform migration project, record assumptions and the evidence that would disprove them.

pipelines architecture and operating boundaries

The architecture for pipelines architecture and operating boundaries must separate control, execution, data and evidence paths. Document trust boundaries, dependencies, quotas, failure domains and who owns each operational decision. Abstraction should reduce repeated work without concealing critical behavior.

models and endpoints with lineage and rollback. automation, policy and evidence

Automation for models and endpoints with lineage and rollback. automation, policy and evidence must be versioned, reviewed and testable. Include schema validation, policy, dry runs or plans, staged promotion, post-change verification and rollback. Manual emergency actions require an owner, timestamp, reason and expiry.

AI Platform Migration Project failure handling and continuous improvement

Continuous improvement for ai platform migration project failure handling and continuous improvement requires observable user outcomes and bounded failure exercises. Test one expected path, one denied path and one dependency failure; then update documentation, alerts and product backlog from the evidence.

Capability and Tool Map

Capability	Tool or pattern	Enterprise use
Primary platform or framework	Migration waves	Implement the core capability and define its service contract.
Automation and integration	adapters	Connect the capability to version-controlled workflows and APIs.
Policy, security or governance	dual run	Constrain behavior with least privilege, validation and exceptions.
Telemetry and operational evidence	Migration waves	Expose health, usage, audit and user-outcome signals.
Lifecycle and recovery	adapters	Define upgrade, rollback, backup, restore and deprecation behavior.
Portfolio proof	dual run	Produce sanitized architecture, test and decision evidence.

Architecture and Operating Decisions

- Start with an explicit consumer outcome and service contract; do not expose a tool merely because it is available.
- Separate control-plane authority from workload execution and minimize the maximum blast radius of credentials, state and change.
- Prefer short-lived identity, immutable artifacts, versioned configuration and automated policy over persistent credentials and console-only workflows.
- Define SLOs, ownership, support, cost allocation, recovery, upgrade and deprecation before broad adoption.
- Preserve an escape hatch with accountable review when the golden path cannot meet a valid requirement.

Reference Service Contract

```
capability: ai_platform_migration_project
owner: platform-or-product-team
consumers: [developer, operator, security, finance]
contract:
  inputs: [request, metadata, policy_context]
  outputs: [resource_or_service, status, evidence]
controls:
  identity: short_lived_and_least_privilege
  policy: versioned_and_tested
  telemetry: metrics_logs_traces_audit
  lifecycle: provision_upgrade_recover_deprecate
validation:
  - approved_path
  - denied_path
  - dependency_failure
  - rollback_or_restore
  - cost_and_ownership_check
volume: 14F
chapter: 65
```

Production Readiness Checklist

- [] Consumers, owner, support tier, lifecycle state and service-level objectives are recorded.
- [] Identity, tenant boundaries, data classification, network paths and secrets are tested.
- [] Configuration and policy are versioned, reviewed, promoted and observable.
- [] Failure, rollback or restore, capacity, quota and dependency behavior have been exercised.
- [] Usage, adoption, user outcomes, cost allocation and exception expiry are measurable.

Troubleshooting Matrix

Symptom	Likely cause	Corrective action	Validation evidence
Request remains pending	Controller, runner or dependency cannot reconcile the desired state	Inspect status conditions, events, queue depth and dependency health; identify the first failing boundary	Successful reconciliation plus latency and audit evidence
User is denied unexpectedly	Identity mapping, policy context or ownership metadata is incomplete	Evaluate effective identity and policy inputs; correct the narrowest cause and rerun denied/allowed tests	Expected allow and deny results with access logs
Change succeeds but user outcome degrades	Technical success criteria do not represent service behavior	Compare SLO, dependency and user-journey signals before and after the change; roll back if needed	Restored SLO and documented causal evidence
Cost or capacity grows unexpectedly	Unbounded defaults, leaks, retries, idle resources or poor allocation	Break down consumption by tenant and unit; apply quota, TTL, scaling or design changes	Reduced unit cost with reliability and quality unchanged

Hands-on Lab 65: Plan and simulate an AI platform migration

Prerequisites

- Disposable local or cloud sandbox with budgets and expiry controls.
- Git, containers, Kubernetes or a documented simulation as appropriate.
- Synthetic identities and data only; do not use employer or customer secrets.

Implementation

1. Define fictional requirements, users, ownership and acceptance criteria for ai platform migration project.
2. Create the smallest safe implementation or detailed simulation using Migration waves, adapters, dual run.
3. Add identity, policy, metadata, telemetry, quota, cost and lifecycle controls.
4. Run one successful user journey and one intentionally denied action.
5. Inject a bounded dependency or configuration failure, diagnose it, recover and record the timeline.
6. Publish a sanitized architecture, runbook, evidence pack and improvement backlog; then clean up all resources.

Validation Evidence

- Architecture and service contract committed to version control.
- Commands, test results, screenshots or exported telemetry for allow, deny and failure scenarios.
- Recovery, cost, ownership, security and cleanup evidence with timestamps.

Interview Questions and Model Answers

1. How would you design AI Platform Migration Project?

Begin with consumers, outcomes, constraints and ownership. Define the service contract and failure boundaries, choose the minimum viable architecture, automate policy and lifecycle, then prove normal, denied and recovery behavior.

2. Which trade-offs would you document?

Document speed versus control, abstraction versus transparency, standardization versus flexibility, managed service versus portability, centralization versus team autonomy, and cost versus resilience.

3. What production evidence is required?

Require version-controlled architecture and configuration, effective-access results, policy tests, user-journey telemetry, SLOs, rollback or restore evidence, ownership, cost allocation and a clean teardown or deprecation path.

4. How would you improve adoption?

Use developer research, remove the largest friction, ship a narrow golden path, publish support and escape hatches, measure time-to-value and satisfaction, and iterate with representative product teams.

Chapter Summary

- AI Platform Migration Project is an owned product or operating capability, not a one-time installation.
- Enterprise readiness requires explicit contracts, boundaries, policy, telemetry and lifecycle controls.
- Adoption and reliability improve when normal, denied and failure behavior are tested with users.
- The lab artifact should show reasoning and evidence, not confidential environment details.

Chapter 66: Complex AI Troubleshooting

Diagnose data, pipeline, GPU, distributed training, serving, retrieval and evaluation failures.

Why this chapter matters: Complex AI Troubleshooting matters because enterprise outcomes depend on more than a successful tool installation. The team must make diagnose data, pipeline, gpu, distributed training, serving, retrieval and evaluation failures. explicit, assign ownership, automate repeatable controls, and retain evidence that the design behaves correctly during normal use, denied use and failure.

Learning Objectives

- Explain the purpose, consumers and enterprise trade-offs of complex ai troubleshooting.
- Design the capability using Logs, traces, profiles, framework diagnostics with explicit ownership and failure boundaries.
- Implement a version-controlled workflow with identity, policy, telemetry and lifecycle controls.
- Troubleshoot common failures and produce evidence suitable for operations, security and architecture review.
- Complete the lab: complete a timed ai failure investigation.

Core Concepts

Diagnose data and problem framing

Diagnose data and problem framing starts with a clear user or business problem. Define the desired outcome, the actors, the service boundary and the constraints before selecting implementation technology. For complex ai troubleshooting, record assumptions and the evidence that would disprove them.

pipeline architecture and operating boundaries

The architecture for pipeline architecture and operating boundaries must separate control, execution, data and evidence paths. Document trust boundaries, dependencies, quotas, failure domains and who owns each operational decision. Abstraction should reduce repeated work without concealing critical behavior.

GPU automation, policy and evidence

Automation for gpu automation, policy and evidence must be versioned, reviewed and testable. Include schema validation, policy, dry runs or plans, staged promotion, post-change verification and rollback. Manual emergency actions require an owner, timestamp, reason and expiry.

distributed training failure handling and continuous improvement

Continuous improvement for distributed training failure handling and continuous improvement requires observable user outcomes and bounded failure exercises. Test one expected path, one denied path and one dependency failure; then update documentation, alerts and product backlog from the evidence.

Capability and Tool Map

Capability	Tool or pattern	Enterprise use
Primary platform or framework	Logs	Implement the core capability and define its service contract.
Automation and integration	traces	Connect the capability to version-controlled workflows and APIs.
Policy, security or governance	profiles	Constrain behavior with least privilege, validation and exceptions.
Telemetry and operational evidence	framework diagnostics	Expose health, usage, audit and user-outcome signals.
Lifecycle and recovery	Logs	Define upgrade, rollback, backup, restore and deprecation behavior.

Capability	Tool or pattern	Enterprise use
Portfolio proof	traces	Produce sanitized architecture, test and decision evidence.

Architecture and Operating Decisions

- Start with an explicit consumer outcome and service contract; do not expose a tool merely because it is available.
- Separate control-plane authority from workload execution and minimize the maximum blast radius of credentials, state and change.
- Prefer short-lived identity, immutable artifacts, versioned configuration and automated policy over persistent credentials and console-only workflows.
- Define SLOs, ownership, support, cost allocation, recovery, upgrade and deprecation before broad adoption.
- Preserve an escape hatch with accountable review when the golden path cannot meet a valid requirement.

Chapter Summary

- Complex AI Troubleshooting is an owned product or operating capability, not a one-time installation.
- Enterprise readiness requires explicit contracts, boundaries, policy, telemetry and lifecycle controls.
- Adoption and reliability improve when normal, denied and failure behavior are tested with users.
- The lab artifact should show reasoning and evidence, not confidential environment details.

Chapter 67: AI and Data Certification Roadmap

Map cloud, Kubernetes, data and ML credentials to practical portfolio evidence.

Why this chapter matters: AI and Data Certification Roadmap matters because enterprise outcomes depend on more than a successful tool installation. The team must make map cloud, kubernetes, data and ml credentials to practical portfolio evidence. explicit, assign ownership, automate repeatable controls, and retain evidence that the design behaves correctly during normal use, denied use and failure.

Learning Objectives

- Explain the purpose, consumers and enterprise trade-offs of ai and data certification roadmap.
- Design the capability using Provider ML certifications, Kubernetes, data credentials with explicit ownership and failure boundaries.
- Implement a version-controlled workflow with identity, policy, telemetry and lifecycle controls.
- Troubleshoot common failures and produce evidence suitable for operations, security and architecture review.
- Complete the lab: create a role-specific certification plan.

Core Concepts

Map cloud and problem framing

Map cloud and problem framing starts with a clear user or business problem. Define the desired outcome, the actors, the service boundary and the constraints before selecting implementation technology. For ai and data certification roadmap, record assumptions and the evidence that would disprove them.

Kubernetes architecture and operating boundaries

The architecture for kubernetes architecture and operating boundaries must separate control, execution, data and evidence paths. Document trust boundaries, dependencies, quotas, failure domains and who owns each operational decision. Abstraction should reduce repeated work without concealing critical behavior.

data and ML credentials to practical portfolio evidence. automation, policy and evidence

Automation for data and ml credentials to practical portfolio evidence. automation, policy and evidence must be versioned, reviewed and testable. Include schema validation, policy, dry runs or plans, staged promotion, post-change verification and rollback. Manual emergency actions require an owner, timestamp, reason and expiry.

AI and Data Certification Roadmap failure handling and continuous improvement

Chapter Summary

- AI and Data Certification Roadmap is an owned product or operating capability, not a one-time installation.
- Enterprise readiness requires explicit contracts, boundaries, policy, telemetry and lifecycle controls.
- Adoption and reliability improve when normal, denied and failure behavior are tested with users.
- The lab artifact should show reasoning and evidence, not confidential environment details.

Chapter 68: Senior MLOps and AI Platform Interviews

Practice lifecycle, architecture, debugging, governance and cost trade-offs.

Why this chapter matters: Senior MLOps and AI Platform Interviews matters because enterprise outcomes depend on more than a successful tool installation. The team must make practice lifecycle, architecture, debugging, governance and cost trade-offs. explicit, assign ownership, automate repeatable controls, and retain evidence that the design behaves correctly during normal use, denied use and failure.

Learning Objectives

- Explain the purpose, consumers and enterprise trade-offs of senior mlops and ai platform interviews.
- Design the capability using System design, whiteboarding, behavioral stories with explicit ownership and failure boundaries.
- Implement a version-controlled workflow with identity, policy, telemetry and lifecycle controls.
- Troubleshoot common failures and produce evidence suitable for operations, security and architecture review.
- Complete the lab: complete a senior ai platform interview loop.

Core Concepts

Practice lifecycle and problem framing

Practice lifecycle and problem framing starts with a clear user or business problem. Define the desired outcome, the actors, the service boundary and the constraints before selecting implementation technology. For senior mlops and ai platform interviews, record assumptions and the evidence that would disprove them.

architecture architecture and operating boundaries

The architecture for architecture architecture and operating boundaries must separate control, execution, data and evidence paths. Document trust boundaries, dependencies, quotas, failure domains and who owns each operational decision. Abstraction should reduce repeated work without concealing critical behavior.

debugging automation, policy and evidence

Automation for debugging automation, policy and evidence must be versioned, reviewed and testable. Include schema validation, policy, dry runs or plans, staged promotion, post-change verification and rollback. Manual emergency actions require an owner, timestamp, reason and expiry.

governance and cost trade-offs. failure handling and continuous improvement

Continuous improvement for governance and cost trade-offs. failure handling and continuous improvement requires observable user outcomes and bounded failure exercises. Test one expected path, one denied path and one dependency failure; then update documentation, alerts and product backlog from the evidence.

Capability and Tool Map

Capability	Tool or pattern	Enterprise use
Primary platform or framework	System design	Implement the core capability and define its service contract.
Automation and integration	whiteboarding	Connect the capability to version-controlled workflows and APIs.
Policy, security or governance	behavioral stories	Constrain behavior with least privilege, validation and exceptions.
Telemetry and operational evidence	System design	Expose health, usage, audit and user-outcome signals.
Lifecycle and recovery	whiteboarding	Define upgrade, rollback, backup, restore and deprecation behavior.

Capability	Tool or pattern	Enterprise use
Portfolio proof	behavioral stories	Produce sanitized architecture, test and decision evidence.

Architecture and Operating Decisions

- Start with an explicit consumer outcome and service contract; do not expose a tool merely because it is available.
- Separate control-plane authority from workload execution and minimize the maximum blast radius of credentials, state and change.
- Prefer short-lived identity, immutable artifacts, versioned configuration and automated policy over persistent credentials and console-only workflows.
- Define SLOs, ownership, support, cost allocation, recovery, upgrade and deprecation before broad adoption.
- Preserve an escape hatch with accountable review when the golden path cannot meet a valid requirement.

3. What production evidence is required?

Require version-controlled architecture and configuration, effective-access results, policy tests, user-journey telemetry, SLOs, rollback or restore evidence, ownership, cost allocation and a clean teardown or deprecation path.

4. How would you improve adoption?

Use developer research, remove the largest friction, ship a narrow golden path, publish support and escape hatches, measure time-to-value and satisfaction, and iterate with representative product teams.

Chapter Summary

- Senior MLOps and AI Platform Interviews is an owned product or operating capability, not a one-time installation.
- Enterprise readiness requires explicit contracts, boundaries, policy, telemetry and lifecycle controls.
- Adoption and reliability improve when normal, denied and failure behavior are tested with users.
- The lab artifact should show reasoning and evidence, not confidential environment details.

Chapter 69: AI Platform Leadership and Product Management

Prioritize platform capabilities, risk, adoption, investments and responsible use.

Why this chapter matters: AI Platform Leadership and Product Management matters because enterprise outcomes depend on more than a successful tool installation. The team must make prioritize platform capabilities, risk, adoption, investments and responsible use. explicit, assign ownership, automate repeatable controls, and retain evidence that the design behaves correctly during normal use, denied use and failure.

Learning Objectives

- Explain the purpose, consumers and enterprise trade-offs of ai platform leadership and product management.
- Design the capability using Roadmaps, risk committees, product analytics with explicit ownership and failure boundaries.
- Implement a version-controlled workflow with identity, policy, telemetry and lifecycle controls.
- Troubleshoot common failures and produce evidence suitable for operations, security and architecture review.
- Complete the lab: run an ai platform quarterly review.

Core Concepts

Prioritize platform capabilities and problem framing

Prioritize platform capabilities and problem framing starts with a clear user or business problem. Define the desired outcome, the actors, the service boundary and the constraints before selecting implementation technology. For ai platform leadership and product management, record assumptions and the evidence that would disprove them.

risk architecture and operating boundaries

The architecture for risk architecture and operating boundaries must separate control, execution, data and evidence paths. Document trust boundaries, dependencies, quotas, failure domains and who owns each operational decision. Abstraction should reduce repeated work without concealing critical behavior.

adoption automation, policy and evidence

Automation for adoption automation, policy and evidence must be versioned, reviewed and testable. Include schema validation, policy, dry runs or plans, staged promotion, post-change verification and rollback. Manual emergency actions require an owner, timestamp, reason and expiry.

investments and responsible use. failure handling and continuous improvement

Continuous improvement for investments and responsible use. failure handling and continuous improvement requires observable user outcomes and bounded failure exercises. Test one expected path, one denied path and one dependency failure; then update documentation, alerts and product backlog from the evidence.

Capability and Tool Map

Capability	Tool or pattern	Enterprise use
Primary platform or framework	Roadmaps	Implement the core capability and define its service contract.
Automation and integration	risk committees	Connect the capability to version-controlled workflows and APIs.
Policy, security or governance	product analytics	Constrain behavior with least privilege, validation and exceptions.
Telemetry and operational evidence	Roadmaps	Expose health, usage, audit and user-outcome signals.
Lifecycle and recovery	risk committees	Define upgrade, rollback, backup, restore and deprecation behavior.

Capability	Tool or pattern	Enterprise use
Portfolio proof	product analytics	Produce sanitized architecture, test and decision evidence.

Architecture and Operating Decisions

- Start with an explicit consumer outcome and service contract; do not expose a tool merely because it is available.
- Separate control-plane authority from workload execution and minimize the maximum blast radius of credentials, state and change.
- Prefer short-lived identity, immutable artifacts, versioned configuration and automated policy over persistent credentials and console-only workflows.
- Define SLOs, ownership, support, cost allocation, recovery, upgrade and deprecation before broad adoption.
- Preserve an escape hatch with accountable review when the golden path cannot meet a valid requirement.

chapter: 69

```

Production Readiness Checklist

- [] Consumers, owner, support tier, lifecycle state and service-level objectives are recorded.
- [] Identity, tenant boundaries, data classification, network paths and secrets are tested.
- [] Configuration and policy are versioned, reviewed, promoted and observable.
- [] Failure, rollback or restore, capacity, quota and dependency behavior have been exercised.
- [] Usage, adoption, user outcomes, cost allocation and exception expiry are measurable.

Troubleshooting Matrix

Symptom	Likely cause	Corrective action	Validation evidence
Request remains pending	Controller, runner or dependency cannot reconcile the desired state	Inspect status conditions, events, queue depth and dependency health; identify the first failing boundary	Successful reconciliation plus latency and audit evidence
User is denied unexpectedly	Identity mapping, policy context or ownership metadata is incomplete	Evaluate effective identity and policy inputs; correct the narrowest cause and rerun denied/allowed tests	Expected allow and deny results with access logs
Change succeeds but user outcome degrades	Technical success criteria do not represent service behavior	Compare SLO, dependency and user-journey signals before and after the change; roll back if needed	Restored SLO and documented causal evidence
Cost or capacity grows unexpectedly	Unbounded defaults, leaks, retries, idle resources or poor allocation	Break down consumption by tenant and unit; apply quota, TTL, scaling or design changes	Reduced unit cost with reliability and quality unchanged

Hands-on Lab 69: Run an AI platform quarterly review

Prerequisites

- Disposable local or cloud sandbox with budgets and expiry controls.
- Git, containers, Kubernetes or a documented simulation as appropriate.
- Synthetic identities and data only; do not use employer or customer secrets.

Implementation

1. Define fictional requirements, users, ownership and acceptance criteria for ai platform leadership and product management.
2. Create the smallest safe implementation or detailed simulation using Roadmaps, risk committees, product analytics.
3. Add identity, policy, metadata, telemetry, quota, cost and lifecycle controls.
4. Run one successful user journey and one intentionally denied action.
5. Inject a bounded dependency or configuration failure, diagnose it, recover and record the timeline.
6. Publish a sanitized architecture, runbook, evidence pack and improvement backlog; then clean up all resources.

Validation Evidence

- Architecture and service contract committed to version control.
- Commands, test results, screenshots or exported telemetry for allow, deny and failure scenarios.
- Recovery, cost, ownership, security and cleanup evidence with timestamps.

Interview Questions and Model Answers

1. How would you design AI Platform Leadership and Product Management?

Begin with consumers, outcomes, constraints and ownership. Define the service contract and failure boundaries, choose the minimum viable architecture, automate policy and lifecycle, then prove normal, denied and recovery behavior.

2. Which trade-offs would you document?

Document speed versus control, abstraction versus transparency, standardization versus flexibility, managed service versus portability, centralization versus team autonomy, and cost versus resilience.

3. What production evidence is required?

Require version-controlled architecture and configuration, effective-access results, policy tests, user-journey telemetry, SLOs, rollback or restore evidence, ownership, cost allocation and a clean teardown or deprecation path.

4. How would you improve adoption?

Use developer research, remove the largest friction, ship a narrow golden path, publish support and escape hatches, measure time-to-value and satisfaction, and iterate with representative product teams.

Chapter Summary

- AI Platform Leadership and Product Management is an owned product or operating capability, not a one-time installation.
- Enterprise readiness requires explicit contracts, boundaries, policy, telemetry and lifecycle controls.
- Adoption and reliability improve when normal, denied and failure behavior are tested with users.
- The lab artifact should show reasoning and evidence, not confidential environment details.

Chapter 70: Final Enterprise AI Delivery Capstone

Deliver data-to-model-to-LLM operations with security, reliability, cost and governance evidence.

Why this chapter matters: Final Enterprise AI Delivery Capstone matters because enterprise outcomes depend on more than a successful tool installation. The team must make deliver data-to-model-to-llm operations with security, reliability, cost and governance evidence. explicit, assign ownership, automate repeatable controls, and retain evidence that the design behaves correctly during normal use, denied use and failure.

Learning Objectives

- Explain the purpose, consumers and enterprise trade-offs of final enterprise ai delivery capstone.
- Design the capability using MLflow, Kubeflow, Ray, KServe, OpenTelemetry with explicit ownership and failure boundaries.
- Implement a version-controlled workflow with identity, policy, telemetry and lifecycle controls.
- Troubleshoot common failures and produce evidence suitable for operations, security and architecture review.
- Complete the lab: defend the final enterprise ai platform.

Core Concepts

Deliver data-to-model-to-LLM operations with security and problem framing

Deliver data-to-model-to-LLM operations with security and problem framing starts with a clear user or business problem. Define the desired outcome, the actors, the service boundary and the constraints before selecting implementation technology. For final enterprise ai delivery capstone, record assumptions and the evidence that would disprove them.

reliability architecture and operating boundaries

The architecture for reliability architecture and operating boundaries must separate control, execution, data and evidence paths. Document trust boundaries, dependencies, quotas, failure domains and who owns each operational decision. Abstraction should reduce repeated work without concealing critical behavior.

cost and governance evidence. automation, policy and evidence

Automation for cost and governance evidence. automation, policy and evidence must be versioned, reviewed and testable. Include schema validation, policy, dry runs or plans, staged promotion, post-change verification and rollback. Manual emergency actions require an owner, timestamp, reason and expiry.

Final Enterprise AI Delivery Capstone failure handling and continuous improvement

Continuous improvement for final enterprise ai delivery capstone failure handling and continuous improvement requires observable user outcomes and bounded failure exercises. Test one expected path, one denied path and one dependency failure; then update documentation, alerts and product backlog from the evidence.

Capability and Tool Map

Capability	Tool or pattern	Enterprise use
Primary platform or framework	MLflow	Implement the core capability and define its service contract.
Automation and integration	Kubeflow	Connect the capability to version-controlled workflows and APIs.
Policy, security or governance	Ray	Constrain behavior with least privilege, validation and exceptions.
Telemetry and operational evidence	KServe	Expose health, usage, audit and user-outcome signals.
Lifecycle and recovery	OpenTelemetry	Define upgrade, rollback, backup, restore and deprecation behavior.

Capability	Tool or pattern	Enterprise use
Portfolio proof	MLflow	Produce sanitized architecture, test and decision evidence.

Architecture and Operating Decisions

- Start with an explicit consumer outcome and service contract; do not expose a tool merely because it is available.
- Separate control-plane authority from workload execution and minimize the maximum blast radius of credentials, state and change.
- Prefer short-lived identity, immutable artifacts, versioned configuration and automated policy over persistent credentials and console-only workflows.
- Define SLOs, ownership, support, cost allocation, recovery, upgrade and deprecation before broad adoption.
- Preserve an escape hatch with accountable review when the golden path cannot meet a valid requirement.

Reference Service Contract

```

capability: final_enterprise_ai_delivery_cap
owner: platform-or-product-team
consumers: [developer, operator, security, finance]
contract:
  inputs: [request, metadata, policy_context]
  outputs: [resource_or_service, status, evidence]
controls:
  identity: short_lived_and_least_privilege
  policy: versioned_and_tested
  telemetry: metrics_logs_traces_audit
  lifecycle: provision_upgrade_recover_deprecate
validation:
  - approved_path

Require version-controlled architecture and configuration, effective-access results, policy tests, user-journey telemetry, SLOs, rollback or restore evidence, ownership, cost allocation and a clean teardown or deprecation path.

4. How would you improve adoption?

Use developer research, remove the largest friction, ship a narrow golden path, publish support and escape hatches, measure time-to-value and satisfaction, and iterate with representative product teams.

Chapter Summary

- Final Enterprise AI Delivery Capstone is an owned product or operating capability, not a one-time installation.
- Enterprise readiness requires explicit contracts, boundaries, policy, telemetry and lifecycle controls.
- Adoption and reliability improve when normal, denied and failure behavior are tested with users.
- The lab artifact should show reasoning and evidence, not confidential environment details.

AI Platform Graduation Reference

Use this reference to review product outcomes, architecture boundaries, operating controls and evidence required for production approval.

Domain	Required outcome	Validation evidence
Product and users	Named consumers, outcome hypothesis, roadmap and lifecycle owner	Research summary, service contract and adoption data
Architecture	Control, execution, data and evidence boundaries with bounded blast radius	Diagrams, ADRs, dependency and failure tests
Identity and security	Least privilege, keyless workloads, protected administration and auditable exceptions	Effective-access, denied-action and audit evidence
Delivery and policy	Versioned automation, policy, promotion, rollback and provenance	Pipeline, policy and artifact verification results
Reliability and operations	SLOs, telemetry, capacity, incident response, recovery and deprecation	Dashboards, game-day timeline and restore evidence
Data and AI governance	Ownership, classification, quality, privacy, lineage and responsible use	Catalog, tests, risk and approval records
Economics and value	Allocated cost, unit economics, investment rationale and optimization safety	Cost model, outcome metrics and decision log
People and governance	Clear decisions, support, skills, change plan and feedback loops	RACI, operating cadence, survey and action backlog

Completion Checklist

- [] I can explain every chapter in Volume 14F using architecture, operations and business language.
- [] I can implement or simulate at least one complete service with identity, policy, telemetry and lifecycle controls.
- [] I can demonstrate expected, denied and failure behavior with time-stamped evidence.
- [] I can discuss security, reliability, cost, adoption and organizational trade-offs.
- [] I can produce a sanitized portfolio artifact and defend the design in an interview or review board.

Additional Portfolio Projects

1. Service catalog and ownership quality automation.
2. Keyless CI/CD and workload-identity reference implementation.
3. Policy promotion pipeline with expiring exceptions.
4. Golden path or pipeline template with user-journey telemetry.
5. SLO dashboard and bounded failure game day.
6. Cost allocation and unit-economics review.
7. Security threat model and evidence-based remediation plan.
8. Backup, restore, failover and failback exercise.
9. Migration or adoption factory for three fictional teams.
10. Executive architecture or investment memo with measured outcomes.

Practice Plan

Days	Focus	Required output
1-5	Concepts, users and current-state discovery	Research notes, value stream and capability map
6-10	Architecture and service contracts	Diagrams, API/schema and ADRs
11-16	Implementation and automation	Working sandbox or detailed simulation
17-21	Security, policy and governance	Threat model, policy tests and exceptions
22-26	Reliability, telemetry and recovery	SLOs, dashboards and failure drill
27-31	Cost, capacity and lifecycle	Unit cost, quota and deprecation plan
32-36	Adoption, people and operating model	RACI, support and change plan
37-41	Troubleshooting and interview practice	Timed investigation and interview notes
42-45	Capstone and portfolio	Final defense, cleanup and sanitized evidence pack

Glossary

Term	Definition
Control plane	The APIs and controllers that accept desired state and coordinate execution.
Developer portal	A user interface that aggregates catalog, documentation, workflows and operational context.
Internal developer platform	The integrated products, APIs, automation and processes that support software delivery.
Golden path	An opinionated, supported default journey for a common engineering task.
Data product	An owned data asset or interface with consumers, quality, documentation and lifecycle.
MLOps	Practices and systems for reproducible, governed delivery and operation of machine-learning models.
LLMOps	Lifecycle, evaluation, deployment, observability, safety and cost practices for LLM applications.
Sociotechnical system	A system whose outcomes emerge from interactions among people, process, incentives and technology.
Unit economics	Cost and value measured per meaningful business or technical output.
Error budget	The allowed unreliability implied by a service-level objective.
Policy as code	Machine-testable policy stored, reviewed and promoted through version control.
Evidence pack	Sanitized architecture, configuration, test, telemetry and decision records used to prove readiness.
